CLOSED-END PRIVATE EQUITY FUND

Illustrative Fund Performance & Modelling Methodology Report

Prepared for professional portfolio demonstration | 31 October 2026

1 | Executive overview

This report describes an illustrative closed-end fund financial model integrating capital commitments, staged investment deployment, equity and debt financing, portfolio income and exits, fund expenses, partnership distributions, and investor-level returns. The model uses dummy inputs and is not a statement of actual fund performance.

2 | Fund structure and illustrative assumptions

Model input	Workbook assumption
Total fund size	$450.0 million
Equity / debt funding	$360.0m / $90.0m (80% / 20%)
Investment period	4 years
Base fund life	8 years; 2 extension years
Investment deployment weights	10%, 20%, 40%, 30% in years 1–4
Illustrative dividend yield / exit multiple	8% / 3.0x

Source: Fund Assumptions worksheet, including cells E21, E24–E27, E30–E35 and J13–J22. Some displayed assumptions are formula-derived and should be checked against the underlying workbook before investment use.

3 | Model-reported portfolio performance

Metric	Illustrative workbook output
Gross portfolio distributions	$1,268.68 million
Gross portfolio contributions	$387.32 million
Gross portfolio profit	$881.36 million
Portfolio IRR	22.77%
Portfolio MOIC	3.28x
LP distributions (post catch-up and carry)	$854.75 million
LP contributions	$316.44 million
LP profit	$538.31 million
LP IRR	18.68%
LP MOIC	2.70x

Source: cached outputs in Fund Summary worksheet, cells H13–H18 and L13–L17. These are model-reported outputs, not independently recalculated or audited results. The workbook may produce different results if inputs change or Excel recalculates.

4 | Fund cash flows, leverage and investment realisations

The Fund Cashflows schedule integrates capital contributions, investment deployment, fees, portfolio income, realisations and fund-level reporting. A dedicated Debt Schedule tracks principal issuance and repayment as well as interest-related cash flows. These schedules should be reviewed together to assess leverage, timing mismatches and the sufficiency of cash for investor distributions.

5 | Partnership waterfall and investor economics

The Partnership Returns schedule models distributions between LPs and GPs, including preferred return, catch-up and carried interest mechanisms. The Investors (LPs) Cash Flows schedule tracks allocations across four LP investors. Distribution priority, catch-up ordering and carry calculations must be interpreted against the actual governing partnership agreement; this illustrative workbook is not a substitute for legal waterfall documentation.

6 | Key performance indicators

IRR measures the annualised, cash-flow-timing-sensitive return. **MOIC** compares aggregate value or proceeds with contributed capital under the applicable calculation. **TVPI** measures distributions plus residual NAV relative to paid-in capital; **DPI** measures realised distributions relative to paid-in capital. These definitions should be applied consistently to gross portfolio and net investor perspectives.

7 | Review status and modelling limitations

The workbook structure and selected saved outputs have been inspected for this report. A complete cell-by-cell formula audit, independent recalculation of the GP/LP waterfall, debt interest testing, stress scenarios and investor-level reconciliation have **not** been completed. Accordingly, the numerical outputs above are labelled illustrative and model-reported, not validated.

Before relying on this model for decision-making, reconcile total sources and uses, debt balances, portfolio NAV, aggregate LP allocations, GP catch-up and carry, and gross-to-net returns. Confirm that any workbook metadata, comments, external links or hidden content are appropriate for public release.

8 | Publication disclaimer

All financial figures and scenarios are illustrative and provided solely to demonstrate financial modelling capability. This report is not investment advice, a solicitation, an offering document or a forecast of actual returns. Fund terms and distributions depend on governing documents and applicable regulation.
